

# Subatomic Particles

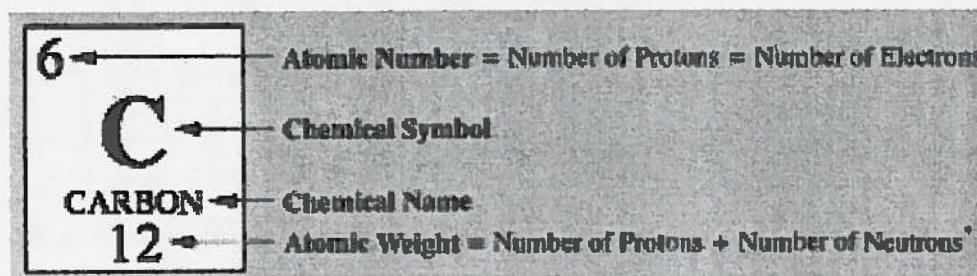

1.
  - a) How can you use the periodic table to determine the number of protons in an atom?
  - b) How can you tell the atomic number from the atomic mass on the periodic table?
2.
  - a) How can you determine the number of electrons in an atom?
  - b) Why do the number of electrons and protons have to be equal?
3.
  - a) What's the difference between the atomic mass and the mass number?
  - b) How can you determine the number of neutrons in an atom?
  - c) How can you be sure which number is the atomic number and which number is the atomic mass?

4. Use the periodic table to complete the table below with the correct information for each atom. Round atomic mass to the nearest whole number to obtain the mass number.

| Element name | Element symbol | Atomic number | Mass number | Number of protons | Number of neutrons | Number of electrons |
|--------------|----------------|---------------|-------------|-------------------|--------------------|---------------------|
| hydrogen     |                |               |             |                   |                    |                     |
| helium       |                |               |             |                   |                    |                     |
| lithium      |                |               |             |                   |                    |                     |
| beryllium    |                |               |             |                   |                    |                     |
| boron        |                |               |             |                   |                    |                     |
| carbon       |                |               |             |                   |                    |                     |
| nitrogen     |                |               |             |                   |                    |                     |
| oxygen       |                |               |             |                   |                    |                     |
| fluorine     |                |               |             |                   |                    |                     |
| neon         |                |               |             |                   |                    |                     |
| sodium       |                |               |             |                   |                    |                     |
| magnesium    |                |               |             |                   |                    |                     |
| aluminum     |                |               |             |                   |                    |                     |
| silicon      |                |               |             |                   |                    |                     |
| phosphorus   |                |               |             |                   |                    |                     |
| sulfur       |                |               |             |                   |                    |                     |
| chlorine     |                |               |             |                   |                    |                     |
| argon        |                |               |             |                   |                    |                     |
| potassium    |                |               |             |                   |                    |                     |

# Elements

Elements in the Periodic Table are identified by their chemical symbol:  
the first letter is capitalized; if a second letter is present, it is lowercase.

The rows of the Periodic Table are called **periods**  
The columns are called **groups or families**.

| Periodic Table of the Elements |    |    |    |     |    |      |    |     |    |    |    |     |    |      |    |       |    | IB  |    | IB |    |    |    |
|--------------------------------|----|----|----|-----|----|------|----|-----|----|----|----|-----|----|------|----|-------|----|-----|----|----|----|----|----|

## Review of Grade 9 Chemistry

*184-186*

SNC2D

*Refer to p. 140 – 148.*

1. Matter is anything that has \_\_\_\_\_ and takes up \_\_\_\_\_.

2. Classify each of the following properties as either physical (P) or chemical (C):

- |                                       |  |                                       |
|---------------------------------------|--|---------------------------------------|
| <input type="checkbox"/> colour       | <input type="checkbox"/> boiling point       | <input type="checkbox"/> flash point  |
| <input type="checkbox"/> flammability | <input type="checkbox"/> malleability        | <input type="checkbox"/> solubility   |
| <input type="checkbox"/> state        | <input type="checkbox"/> reaction with water | <input type="checkbox"/> conductivity |

3. Match each of the following terms to its definition:

- |  |   |
|--|---|
| <input type="checkbox"/> compound              | A. matter made up of only one kind of particle            |
| <input type="checkbox"/> element               | B. a mixture that looks the same throughout               |
| <input type="checkbox"/> heterogeneous mixture | C. a pure substance made from two or more elements        |
| <input type="checkbox"/> homogeneous mixture   | D. a homogeneous mixture of a substance in a liquid       |
| <input type="checkbox"/> mixture               | E. a pure substance made from only one kind of atom       |
| <input type="checkbox"/> pure substance        | F. a mixture in which different parts are visible         |
| <input type="checkbox"/> solution              | G. a cloudy liquid mixture in which particles may be seen |
| <input type="checkbox"/> suspension            | H. a combination of pure substances                       |

4. Complete the following table:

| Atomic Particle | Symbol | Mass (amu) | Charge | Location                          |
|-----------------|--------|------------|--------|-----------------------------------|
| Proton          |        |            |        |                                   |
|                 |        | 1          | 0      |                                   |
|                 |        |            |        | in shells surrounding the nucleus |

5. Explain what determines the atomic number of an element:

---

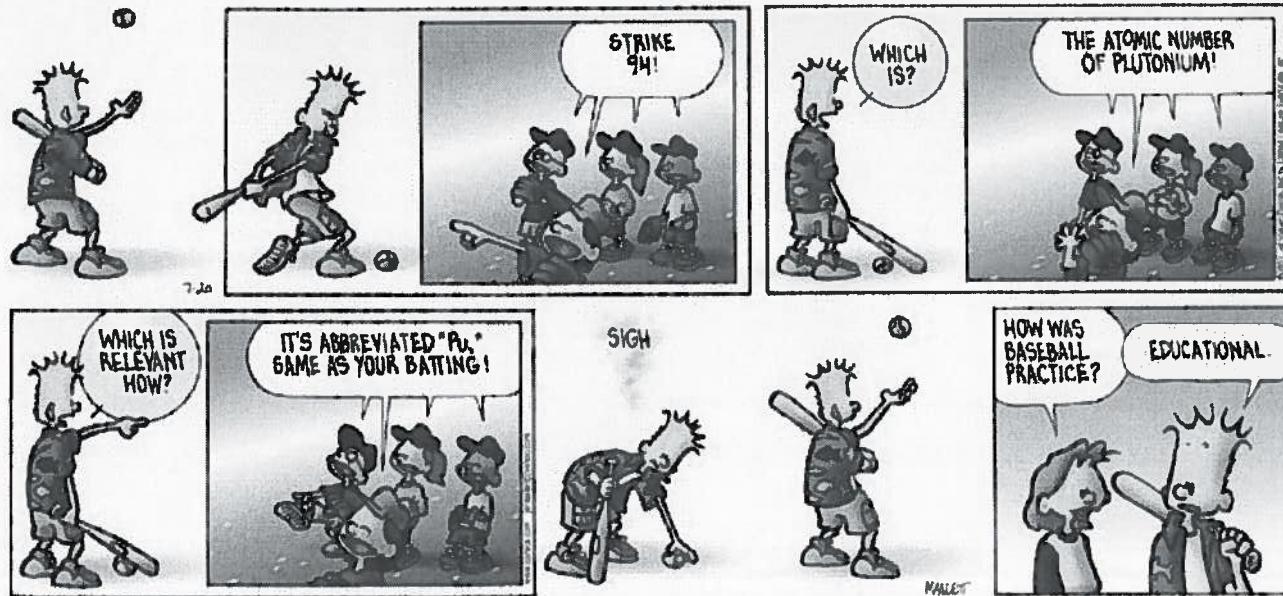

Explain what determined the atomic mass number of an element:

---

6. Complete the following table:

| Name    | Symbol | Atomic Number | Atomic Weight | Number of Protons | Number of Electrons | Number of Neutrons |
|---------|--------|---------------|---------------|-------------------|---------------------|--------------------|
| Carbon  | C      | 6             | 12            |                   |                     |                    |
| Sodium  |        |               |               |                   |                     |                    |
|         | F      |               |               |                   |                     |                    |
|         |        | 1             |               |                   |                     |                    |
| Neon    |        |               | 13            |                   |                     |                    |
|         | Mg     |               |               |                   |                     |                    |
|         |        | 18            |               |                   |                     |                    |
| Silicon |        |               |               |                   |                     |                    |
|         | K      |               |               |                   |                     |                    |
|         |        | 3             |               |                   |                     |                    |
| Calcium |        |               |               |                   |                     |                    |
|         |        | 17            |               |                   |                     |                    |
|         | P      |               |               |                   |                     |                    |
| Gold    |        |               |               |                   |                     |                    |

Note: You *can* have a different number of neutrons in the nucleus without changing the type of element; these atoms with different numbers of neutrons are called *isotopes*.

7. In the periodic table below, colour the metals green, the metalloids purple, and the non-metals yellow.

| The Periodic Table of the Elements |                      |                      |                      |                      |                      |                      |                      |                      |                      |                      |                      |                      |                      |                      |                      |                     |                     |                   |  |

8. Metals may be found on the \_\_\_\_\_ side of the periodic table.

Non-metals may be found on the \_\_\_\_\_ side of the periodic table.

The horizontal rows of the periodic table are called \_\_\_\_\_.

Elements in the same row have the same number of \_\_\_\_\_.

The vertical columns of the periodic table are called \_\_\_\_\_.

Elements in the same column have the same number of \_\_\_\_\_.

Which column contains the most reactive metals? What is the name for these elements?

Which column contains the most reactive non-metals? What is the name for these elements?
